

Considerations for Your Mobile Healthcare Technology Needs

As the healthcare industry evolves through COVID-19 and beyond, the focus on optimizing care coordination is intensifying. Driven by consumer demand for speed and convenience, as well as ever-expanding government compliance standards, health providers will need to prioritize solutions like mobile technology more than ever before.

Mobile care coordination tools help caregivers in the field by streamlining and improving processes; however, some products and services provide better results than others. Here are five attributes all providers should look for when evaluating mobile healthcare technology options.

1. The Tool is Secure and Compliant

Your organization will need a [secure messaging app](#) as physicians, nurses, patients and administrators share Protected Health Information (PHI) via mobile devices. To be HIPAA-compliant, the app should store all PHI captured on the device remotely and offer additional security features like two-factor authentication, end-to-end encryption and fingerprint authentication.

2. It has Built-in Capability to Integrate with Your EHR and Other Healthcare Applications

Messages containing data, documents and images should be seamlessly and automatically archived and attached to a patient chart so the information can be accessed later as needed.

3. It's Easy to Use, Streamlining Communication and Document Capture

An app should allow instant collaboration and communication with your entire team as well as outside healthcare providers. While many apps offer this function, only [Forcura's mobile solution](#) ensures comprehensive security for communications, and the additional ability to scan and capture documents and perform wound measurement from the same interface.

4. Administrators Have Plenty of Control and Visibility

Your administrator should be able to see how other employees are following processes for documentation, communication and approvals, and have appropriate access to guide or provide support for team members at any point.

5. It Improves Patient Care

Organizations need applications that facilitate complete, real-time communication between internal and external stakeholders. They should also allow clinicians to easily perform documentation collection and transport so they can maintain their focus on compassionate patient care.

Forcura's care coordination software is the leading HIPAA-compliant mobile solution designed for healthcare organizations. Visit [our website](#) and find out more today.
